

| About Us |

Hi, we are Henk and Cornelis. We started doing backups as a side-line venture in 2007. A simple software application was developed to allow clients to schedule automated backups from their source workstation to secondary storage locations on the network and/or removable storage disks.

In 2013 we started offering a new product that enables backups to the cloud. This service has since become a full-time venture, hence the official launch of TwiinCloud.

We also offer IT services, like network infrastructure, sales and consulting.

| Our Clients |

We focus on small to medium enterprises – people we can build personal relationships with. Our client base typically ranges from one-man-shops like doctors, brokers and lawyers to agencies and schools.

| Our Service |

Our application is installed on your source workstation from where the backups are performed. The application can be configured to backup specific folders and files, and scheduled to run at a specific time of day, every day. You may also select to have your data encrypted with a user defined key to keep it confidential.

You can then restore your data, or just selected files, via the application – at your own leisure, at any time.

At your request, we will perform backup restores to validate the integrity of the backups.

Backups are stored at our facilities in Randburg.
